The basics

Creating a chart for temp and rate

`geom_point` known as scatter plot is good for two quantitative variable

```
ggplot(crickets, aes(x = temp,
                     y = rate)) +
  geom_point()
```

To label the chart

```
ggplot(crickets, aes(x = temp,  
                     y = rate)) +  
  geom_point() +  
  labs(x = "Temperature",  
       y = "Chirp rate",  
       title = "Cricket chirps",  
       caption = "Source: McDonald (2009)")
```

Source: McDonald (2009)

```
ggplot(crickets, aes(x = temp,
                     y = rate,
                     color = species)) +
  geom_point() +
  labs(x = "Temperature",
       y = "Chirp rate",
       color = "Species",
       title = "Cricket chirps",
       caption = "Source: McDonald (2009)")
```

To change the color of the charts based on the different species, you add `color = species`

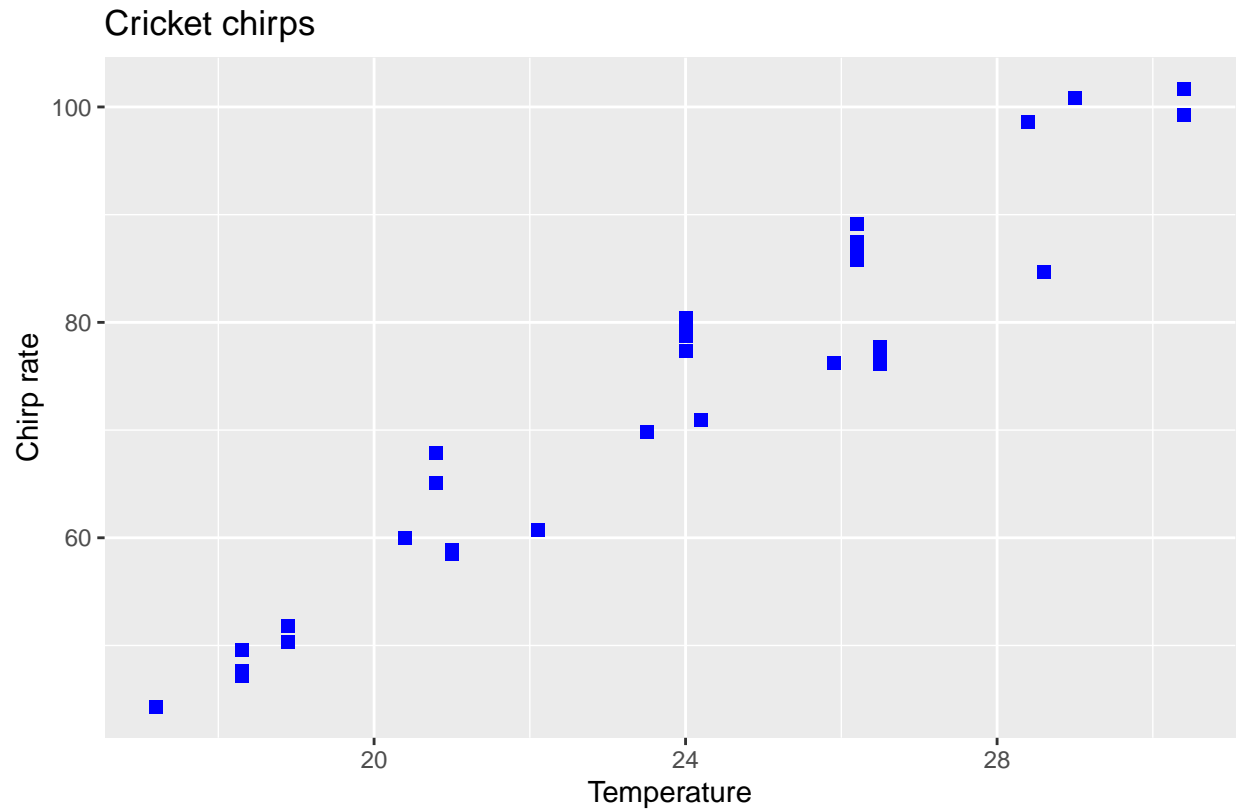

To get a darker shade of the color using `scale_color_brewer`

```
ggplot(crickets, aes(x = temp,
                     y = rate,
                     color = species)) +
  geom_point() +
  labs(x = "Temperature",
       y = "Chirp rate",
       color = "Species",
       title = "Cricket chirps",
       caption = "Source: McDonald (2009)") +
  scale_color_brewer(palette = "Dark2")
```

Modifying basic properties of the plot

```
ggplot(crickets, aes(x = temp,
                     y = rate)) +
  geom_point(color = "blue",
            size = 2,
            shape = "square") +
  labs(x = "Temperature",
       y = "Chirp rate",
       title = "Cricket chirps",
       caption = "Source: McDonald (2009)")
```

Source: McDonald (2009)

Adding another layer `geom_smooth` to show the direction of the relationship

```
ggplot(crickets, aes(x = temp,
                     y = rate)) +
  geom_point() +
  geom_smooth() +
  labs(x = "Temperature",
       y = "Chirp rate",
       title = "Cricket chirps",
       caption = "Source: McDonald (2009)")
```

```
## 'geom_smooth()' using method = 'loess' and formula = 'y ~ x'
```

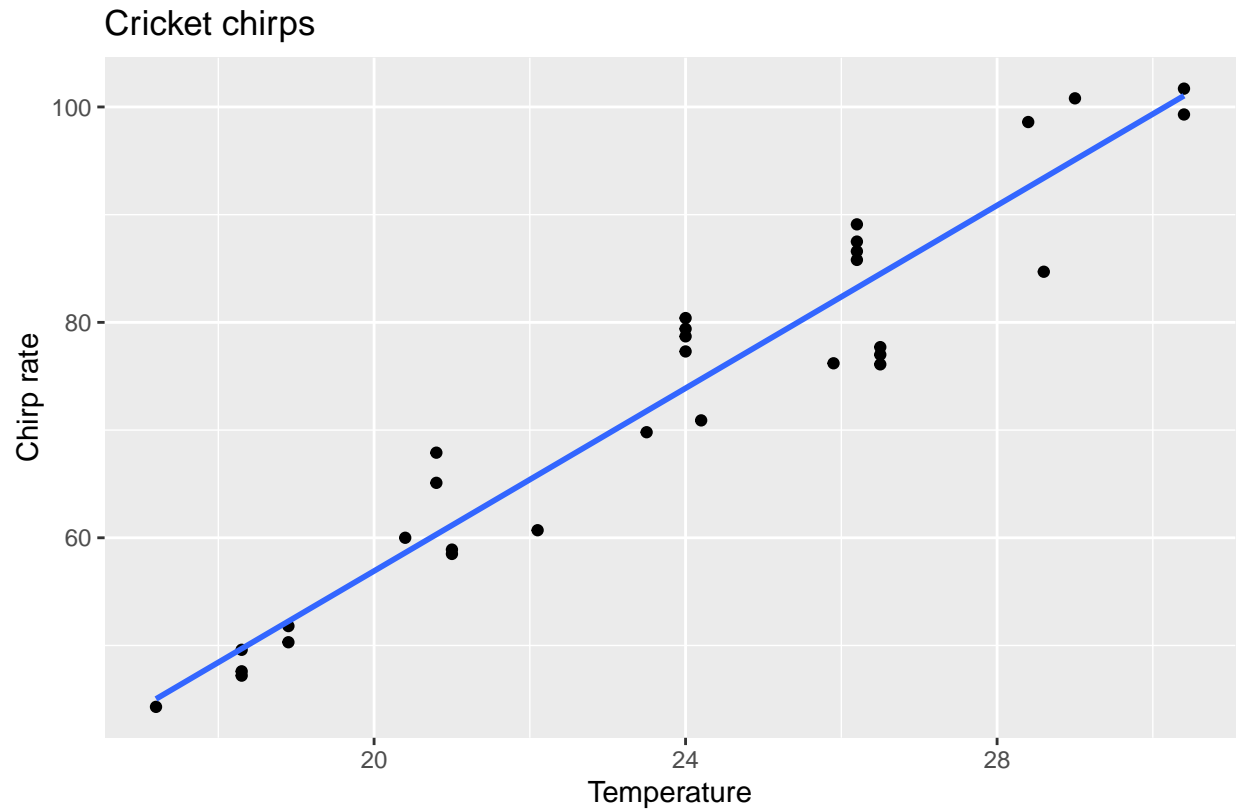

Source: McDonald (2009)

To modify the `geom_smooth`

```
ggplot(crickets, aes(x = temp,
                     y = rate)) +
  geom_point() +
  geom_smooth(method = "lm", # to make the line linear
             se = FALSE) + # se = false takes away the shadow from the line
  labs(x = "Temperature",
       y = "Chirp rate",
       title = "Cricket chirps",
       caption = "Source: McDonald (2009)")
```

'geom_smooth()' using formula = 'y ~ x'

Source: McDonald (2009)

```
ggplot(crickets, aes(x = temp,
                     y = rate,
                     color = species)) + # to differentiate between the different species
  geom_point() +
  geom_smooth(method = "lm",
              se = FALSE) +
  labs(x = "Temperature",
       y = "Chirp rate",
       color = "Species",
       title = "Cricket chirps",
       caption = "Source: McDonald (2009)") +
  scale_color_brewer(palette = "Dark2") # to make the colors darker
```

```
## 'geom_smooth()' using formula = 'y ~ x'
```

Source: McDonald (2009)

Other plots ### Histogram- mostly use for one quantitative variable

```
ggplot(crickets, aes(x = rate)) +  
  geom_histogram(bins = 15) # bin represents a group or a segment of the data, interval into which the
```

Geom_freqpoly - uses lines to represent the frequency distribution of a continuous variable.

```
ggplot(crickets, aes(x = rate)) +  
  geom_freqpoly(bins = 15)
```

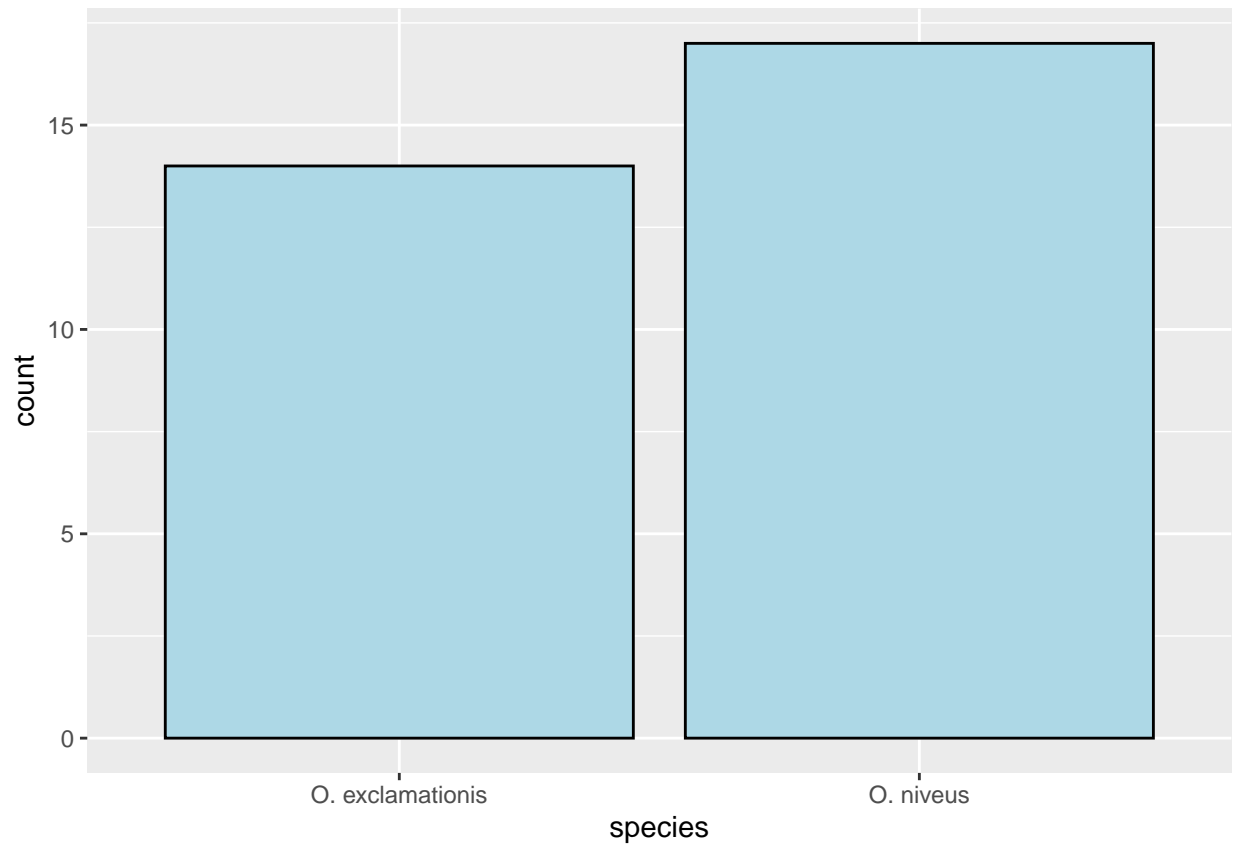

Bar chart mostly used for one categorical variable

```
ggplot(crickets, aes(x = species)) +  
  geom_bar()
```

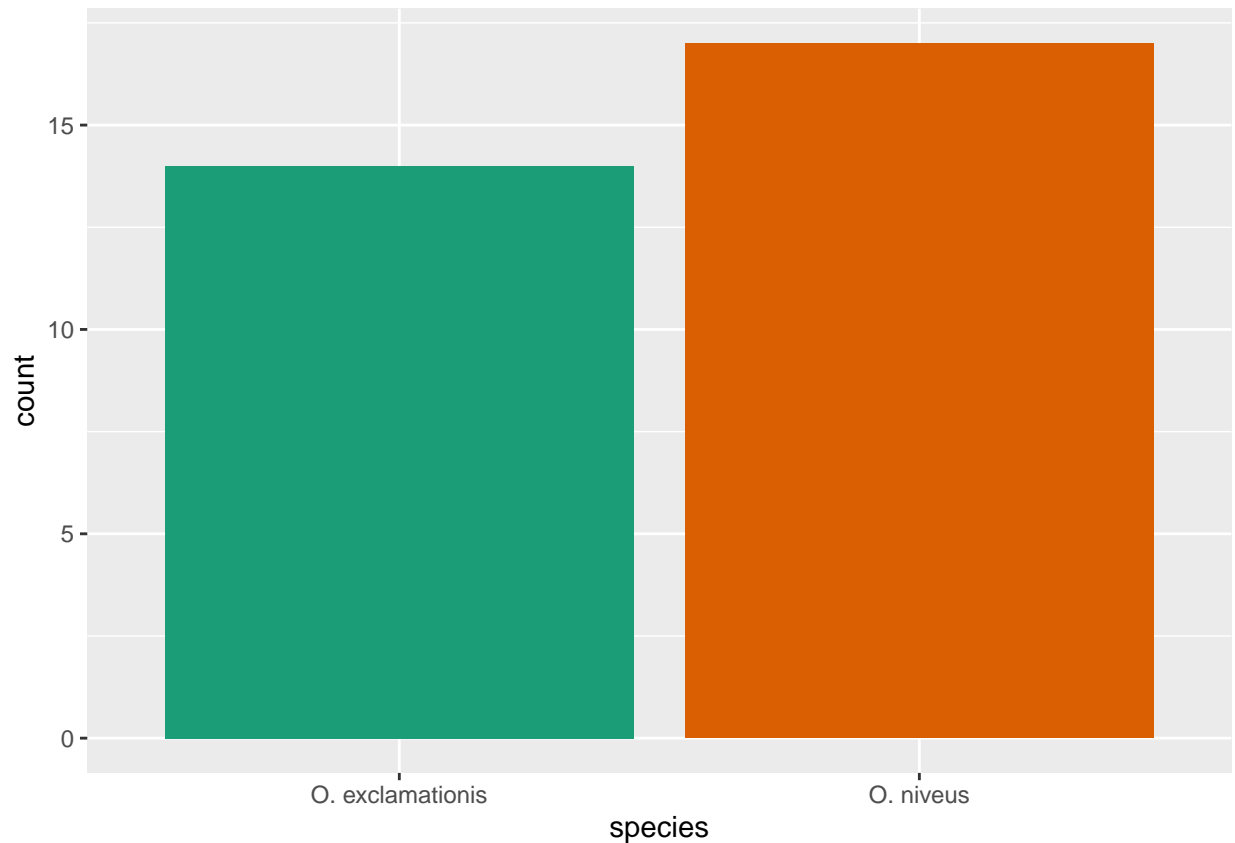

Modification of the Bar chart output ##### To change the outer and inner color of the bar

```
ggplot(crickets, aes(x = species)) +  
  geom_bar (color = "black", # color function works for the borders of the chart  
fill = "lightblue") # fill for the inside
```

To give the values in a variable different colors - here species

```
ggplot(crickets, aes(x = species,  
                     fill = species)) +  
  geom_bar(show.legend = FALSE) + # to remove the legend from the chart  
  scale_fill_brewer(palette = "Dark2") # to make the fill darker
```

Geom_boxplot is good for one categorical and one quantitative variables

Boxplot is a visual representation of your 5 number summary; minimum - the line below

```
ggplot(crickets, aes(x = species,  
                     y = rate,  
                     color = species)) +  
  geom_boxplot(show.legend = FALSE) +  
  scale_color_brewer(palette = "Dark2") # To make the color darker
```

1st quartile, the 2nd quartile which is the medium (the line in-between), the 3rd quartile and

the max - the line above

Theme() - control all non-data display. Use theme() if you just need to tweak the display of an existing, we have theme.minimal,classic,bw,light etc

```
ggplot(crickets, aes(x = species,  
                     y = rate,  
                     color = species)) +  
  geom_boxplot(show.legend = FALSE) +  
  scale_color_brewer(palette = "Dark2") +  
  theme_minimal()
```

To remove the gray background in the chart using theme minimal

Faceting

```
ggplot(crickets, aes(x = rate,  
                     fill = species)) +  
  geom_histogram(bins = 15) +  
  scale_fill_brewer(palette = "Dark2")
```

Without Faceting

```
ggplot(crickets, aes(x = rate,
                     fill = species)) +
  geom_histogram(bins = 15,
                show.legend = FALSE) +
  facet_wrap(~species) +
  scale_fill_brewer(palette = "Dark2")
```

With faceting

To have just one column - the second bar will be below the first

```
ggplot(crickets, aes(x = rate,
                     fill = species)) +
  geom_histogram(bins = 15,
                 show.legend = FALSE) +
  facet_wrap(~species,
             ncol = 1) +
  scale_fill_brewer(palette = "Dark2") +
  theme_minimal()
```
